Please see back for additional important information.

**The core components of the quality scoring model are based on quantitative ranking of various metrics obtained from company filings. These scores have three components: Management Expertise (e.g. corporate finance activities). Profitability (e.g. assess the reliability and the sustainability of financial performance and Cash flow (e.g. cash flow generation).*

***Liquidity of an asset measures the extent to which that asset can be bought or sold in the market without impacting the price of the asset.*

****Beta is a statistical measure of the volatility, or sensitivity, of rates of return on a portfolio or security compared to a market index. The beta for an ETF measures the expected change in return of the ETF relative to the return of a designated index. By definition, the beta of the Standard & Poor's (S&P) 500 Index is 1.00. Accordingly, a fund with a 1.10 beta is expected to perform 10% better than the S&P 500 Index in rising markets and 10% worse in falling markets.*

An investment in FlexShares is subject to numerous risks, including possible loss of principal. Fund returns may not match the return of the respective indexes. A full description of risks is in the prospectus.

The FlexShares US Quality Low Volatility Index Fund (QLV) is passively managed and uses a representative sampling strategy to track its underlying index. Use of a representative sampling strategy creates tracking risk where the Fund's performance could vary substantially from the performance of the underlying index along with the risk of higher portfolio turnover. Although the fund seeks lower volatility than the broader U.S. equity market, there is no guarantee it will be successful as securities or other assets in the Fund's portfolio may be subject to greater price volatility than the market as a whole. The Fund may also invest in derivative instruments. Changes in the value of the derivative may not correlate with the underlying asset, rate or index and the Fund could lose more than the principal amount invested. The Fund is also at increased risk of Industry Concentration, where it may be more than 25% invested in the assets of a single industry.
